

DIGITAL SIGNAGE

with Arrowlogic

Simple to Use

Rich in Feature

Fully Multi Media

Easy expansion

Qdis

is a simple to use yet dynamic digital signage software that allows for remote management of contents on the LCD Screen. Qdis has 3 basic panes to display different contents such as videos, e-posters, live TV Channels, scrolling text and dynamic contents.

There are 2 components in Qdis, the Head and Branch. Head is the administrative portion of the Qdis whereby the users input the contents and set the display time. Branch is the display portion to be installed into LCD controller and is used to display the contents created. Users can have 1 Head and multiple Branches for different contents.

User Friendly

The Head software is designed to be exactly the same as the branch software, therefore what the users created in the Head Software will look exactly the same as the Branch Software. Therefore users will not have to worry about the layout issue. Users can easily upload the contents in less than 5 mouse clicks and save in multiple files.

Security

The Head software has multiple login access rights that can allow users to only create contents but not allowed to publish them. Only the approving officer can publish them after verification.

Supported Formats

Qdis supports the follow picture formats: BMP, JPG, GIF, TGA

Qdis supports the follow video formats: AVI, QT, MOV, MPG, MPEG, m1v, WMV, ASF
